

Portfolio video scripts

Three 2-minute scripts for the hero-video slots on [index.html](#) , [lycia.html](#) , and [science37.html](#) .

Pacing target: **150–160 words per minute** (conversational, not rushed). Each script is ~290–310 words. Read once for time before recording — natural pauses and screen pointing usually push it slightly past 2 minutes, which is fine.

1. Home ([index.html](#)) — about Harun + portfolio overview

Length: ~290 words · ~1:55

Hi, I'm Harun Tuncelli. Welcome.

I'm Director of Product at Lycia AI in San Diego, where we build autonomous AI agents for hospitality — the guest-facing system now deployed in hotels, airports, malls, restaurants, and offices. Before Lycia, I spent six years across UI and UX in San Francisco Bay Area healthcare startups.

This site is my portfolio. There are three featured projects up top, and eighteen pieces of earlier design work in the grid below.

The first featured project is Lycia AI itself. That's where I'm Director of Product today, shipped end-to-end. The Lycia page walks through the live product, the market research behind it, the multi-sided commerce thesis driving the next expansion, customer case studies with real dollar outcomes, and a working concept demo of an AI-native PMS for independent hotels.

The second featured project is Science 37, where I led design on Work Calendar — the scheduling system for decentralized clinical trials. It coordinates three hundred and thirty mobile clinicians across forty-six home states and four active studies. Outcomes: thirty-one percent increase in scheduling efficiency, fifty percent reduction in scheduling personnel.

The third featured project is Remedly, where I worked as a UI/UX designer on the electronic health record system — the practitioner web platform, the tablet medical app, and the brand system around them.

Below the featured work, the earlier design grid: PicturePals, Hubhaus, Kizen CRM, Remedly social ads, packaging design, brand systems. The visual craft layer underneath the product work I do today.

If you have ten minutes, click into Lycia or Science 37 — those are the deep portfolios. If you have two, the featured cards tell you the headline of each.

Email me at harun@lycia.app, or find me on LinkedIn. I'd love to talk.

2. Lycia AI ([lycia.html](#)) — Director of Product portfolio

Length: ~310 words · ~2:00

Hi, I'm Harun. This is the Lycia AI portfolio.

Lycia is an autonomous AI agent for hospitality, deployed in hotels, airports, malls, restaurants, and offices. I'm the Director of Product. I shipped this end-to-end, and I lead the strategy for what comes next.

This page is a ten-minute tour, in three stops. The thesis explains why Lycia's next move is a multi-sided AI commerce network. The concept demo is an AI-native PMS for the long tail of independent hotels — the gap our overlay model can't reach today. And a forty-page market analysis is the evidence base behind both.

A few high-value sections to call out.

The thesis section sketches the four-vertical network — hotels, restaurants, music venues, and activities — and why each new participant makes the network more valuable for everyone already in it.

The case studies are where I think a reviewer should spend the most time. Three composite customer deployments with dollar-level outcomes, and a first-person walkthrough of an AI-first inbox decision I shipped — what I considered, what I chose, the thirty-day metrics, and a sequencing mistake I'd undo if I could.

The concept demo section walks six surfaces of an AI-first PMS — about twenty-five thousand lines of working front-end code with localStorage persistence. It's a concept, not a shipping product, but it's real working software.

The research section holds the strategy thesis, the market analysis, and a designed customer journey for a real San Diego boutique hotel.

And the decks section bundles the partnership and revenue-engine pitches for every supply-side vertical — the sales artifacts I built alongside the product.

If you're in product or design and want to talk hospitality AI, I'd love to connect. Email's harun@lycia.app.

3. Science 37 ([science37.html](#)) — Sr. Product Designer, Work Calendar

Length: ~305 words · ~1:58

Hi, I'm Harun. This is the Work Calendar portfolio from Science 37.

Work Calendar is the scheduling system that powers Science 37's decentralized clinical trials. As Senior Product Designer, I led the end-to-end design — discovery research, concept validation, the shipped UI, and the product architecture behind it.

The system coordinates three hundred and thirty mobile clinicians across forty-six home states, four active studies, and two hundred enrolled participants. Outcomes: thirty-one percent increase in scheduling efficiency, and fifty percent reduction in scheduling personnel.

This page is a ten-minute tour, in three stops — the discovery research, the full case study, and the product architecture. Each stop opens the actual deliverable as a PDF.

A few high-value sections to call out.

The outcomes grid up top shows the four numbers that justify the work — the thirty-one percent, the fifty percent, the three-hundred-and-thirty-clinician roster broken out by role, and the four studies with their visit cadences.

The product section walks six of the eleven shipped surfaces. The one I'd flag for any reviewer is Optimize Day — a 2-opt drive-time optimizer that treats a nurse's day as a Travelling Salesman instance anchored at her home address. Nearest-neighbor seed, 2-opt local search, before-and-after diff side by side. One click to accept the shorter route. That feature alone moved hours of back-office work each week.

The Smart Match panel is the second I'd call out — one click pairs the right RN, CRC, and investigator with the right visit, filtered by license, study training, and drive distance from the clinician's home address.

Below the product walk, an eleven-screenshot gallery of the shipped UI, and four bound PDF deliverables — discovery, concept validation, the full case study, and the architecture document.

If you want the deepest read, the case study PDF walks every surface with the design rationale behind each decision.

Email me at harun@lycia.app.

Recording notes

- **Pace:** read at the pace you'd talk to a hiring manager — not slow, not rushed.
- **Numbers:** spell out percentages and counts naturally ("thirty-one percent," "three hundred and thirty"). Already written that way above.
- **B-roll cues (optional):** when you say "this page is structured as a ten-minute tour," the screen can cut to the tour section anchored on each page. When you mention a specific PDF, cut to that PDF cover.
- **Outro:** all three end with the email — keeps the call to action consistent across the videos.
- **Re-recording:** if a take runs over 2:15, trim the middle section, not the intro or the outro.
